

Acknowledgements

Any research conducted nowadays is marked by a high level of collaboration, even more so, when working in an interdisciplinary area of research. Hence, the work described in this book would have been impossible without the invaluable contributions, inspirations and comments of several colleagues. I would like to express my gratitude to the partners working in the EC-funded research project OMNIITOX for their excellent cooperation which has inspired me in developing the environmental fate, exposure and impact assessment model. In this respect, I especially feel grateful for fruitful discussions with Dr. David W. Pennington who also contributed to outlining Table 2-3.

In addition to that, I would like to thank my supervisors, Dr.-Ing. Rainer Friedrich and Dr. Olivier Jolliet, as the work described here would have not been possible without their fair comments and experience.

Special thanks go to my colleagues at the Institute of Energy Economics and the Rational Use of Energy, University of Stuttgart, Germany, for offering helpful comments and providing support especially with respect to database, Geographic Information System (GIS) and programming skills. I am particularly grateful for the implementation of trace elements into the software tool EcoSense and the provision of the respective deposition fields by my colleague Dr.-Ing. Bert Droste-Franke.

Furthermore, the developed approach relies on many data. I want to express my gratitude for all those data that are freely distributed especially when they have already been financed by the public (i.e., through taxes) as is regularly the case in the US. I also gratefully acknowledge the provision of global hydrological and lake data by the Center for Environmental Systems Research, University of Kassel, Germany.

The financial support of the European Commission through the “Energy, environment and sustainable development” programme given to the NewExt (New elements for the assessment of external costs from energy technologies, EC Project number: ENG1-2000-00129) and GREENSENSE projects (An applied

integrated environmental impact assessment framework for the European union, EC Project number: EVG1-2000-00022) as well as through the “Sustainable and Competitive Growth” research programme given to the OMNIITOX-project (Operational Models aNd Information tools for Industrial applications of eco/TOXicological impact assessments, EC Project number: GIRD-CT-2001-00501) is also acknowledged. The realisation of this work would not have been accomplished without this external funding. In addition, I would like to thank the foundation *Stiftung Landesbank Baden-Württemberg: nature and the environment* for awarding a grant to this work.

And last but - for sure - not least, there is no way to adequately express my gratitude for the patient support of my wife, Martina Bachmann, who encouraged me to pursue my goals and, thus, has a considerable share in the realisation of this book. Also the birth of my two daughters, Lea and Mara, during the development of this work has been very inspiring and brought new perspectives and a so far unexperienced kind of happiness into my life.
