## TABLE OF CONTENTS

	TITLE	PAGE
	<b>TABLE OF CONTENTS</b>	ii
	<b>LIST OF TABLES</b>	iii
	<b>LIST OF FIGURES</b>	iii
	<b>LIST OF APPENDICES</b>	iii
	<b>LIST OF ABBREVIATIONS</b>	v
	<b>LIST OF GLOSSARY</b>	vi
	<b>FOREWORD</b>	x
	<b>IMPORTANT NOTICE</b>	xi
<b>PART I</b>	<b>INTRODUCTION</b>	1
	1. Introduction	2
	2. Definition Of Scheduled Waste In Malaysia	2
	3. Hazardous Waste Characteristics	3
<b>PART II</b>	<b>PART II IDENTIFICATION AND CLASSIFICATION</b>	14
	4. Identification And Classification Of Scheduled Waste	15
	5. Properties And Descriptions Of Scheduled Waste	18
	6. Criteria for Identifying the Characteristics of Scheduled Wastes	23
	7. Summary for Identification of Hazardous and Scheduled Waste Characteristics	25
	8. Typical Categories of Scheduled Wastes	26
	9. Selection Of Containers Storing Scheduled Wastes	65

10. Labelling Of Scheduled Wastes Containers	70
11. Placing/Filling/Packing of Incompatible Scheduled Wastes In Containers	74
12. Other Documents	74
<b>REFERENCES</b>	90

### **LIST OF TABLES**

	<b>TITLE</b>	<b>PAGE</b>
<b>Table 1</b>	Characteristics Of Hazardous Wastes	5
<b>Table 2</b>	Basis for Scheduled Wastes Identification	19
<b>Table 3</b>	Suggested packaging according to waste types and characteristics	67

### **LIST OF FIGURES**

	<b>TITLE</b>	<b>PAGE</b>
<b>Figure 1</b>	Diagram of Characteristics Of Hazardous Wastes	4
<b>Figure 2</b>	Hazardous Properties, Characteristics And Criteria Of Scheduled Wastes	13
<b>Figure 3</b>	Identification Of Hazardous Wastes	16
<b>Figure 4</b>	Example of Identifying Scheduled Wastes from Printing Industry	17
<b>Figure 5</b>	Scheduled Wastes Identification Process	18
<b>Figure 6</b>	Physical Nature Of Wastes	22

<b>Figure 7</b>	Systematic Approach To Determine, Identify And Classify Scheduled Wastes	23
<b>Figure 8</b>	Typical Categories of Scheduled Wastes	26
<b>Figure 9</b>	Examples of waste characteristic labels	71
<b>Figure 10</b>	Example of label for scheduled wastes container	73

### **LIST OF APPENDICES**

	<b>TITLE</b>	<b>PAGE</b>
<b>Appendix 1</b>	Table 1. Maximum Concentration of Contaminants for the Toxicity Characteristic Leaching Procedure (TCLP)	75
<b>Appendix 2</b>	Table 2. Compositional Analysis (Dry Basis)	77
<b>Appendix 3</b>	Third Schedule  Labelling Requirement For Scheduled Wastes	80
<b>Appendix 4</b>	Scheduled Wastes Of Potential Incompatibility	86

	<b>TITLE</b>	<b>PAGE</b>
	<b>LIST OF DEPARTMENT OF ENVIRONMENT (DOE) OFFICES</b>	91

## LIST OF ABBREVIATIONS

<b>Ag</b>	Silver
<b>Al</b>	Aluminium
<b>As</b>	Arsenic
<b>Ba</b>	Barium
<b>Be</b>	Beryllium
<b>Cd</b>	Cadmium
<b>CFR</b>	Code of Federal Regulations
<b>Cr</b>	Chromium
<b>Cu</b>	Copper
<b>F</b>	Fluorine
<b>Hg</b>	Mercury
<b>Li</b>	Lithium
<b>Mn</b>	Manganese
<b>MSDS</b>	Material Safety Data Sheet
<b>Ni</b>	Nickel
<b>Pb</b>	Plumbum
<b>Pb</b>	Lead
<b>PCB</b>	polychlorinated biphenyls
<b>PCT</b>	polychlorinated triphenyls
<b>Sb</b>	Antimony
<b>Se</b>	Selenium
<b>Se</b>	Selenium
<b>Sn</b>	Tin
<b>SW</b>	Scheduled wastes
<b>TCLP</b>	Toxicity Characteristic Leaching Procedure
<b>Te</b>	Tellurium
<b>Th</b>	Thorium
<b>USEPA</b>	United States Protection Agency
<b>V</b>	Vanadium

## GLOSSARY

<b>Aluminium smelting</b>	The process of extracting aluminium from its oxide, alumina, generally by the Hall-Héroult electrolysis process. Alumina is extracted from the ore bauxite by means of the Bayer process at an alumina refinery
<b>Boiling point</b>	Temperature at which a liquid starts to boil and become a gas.
<b>Corrosivity characteristic</b>	Corrosivity characteristic identifies wastes that are acidic or alkaline (basic) which can readily corrode or dissolve flesh, metals or other materials.
<b>Density</b>	A measurement of mass contained in a given unit volume; mass/volume
<b>Fire point</b>	Temperature at which the vapour concentration of combustible liquid is sufficient to sustain combustion
<b>Flash point</b>	Temperature at which a substance give off sufficient amount of vapour to form ignitable mixture with air.
<b>Galvanizing process</b>	The process of applying a protective zinc coating to steel or iron, to prevent rusting. The most common method is hot-dip galvanization, in which parts are submerged in a bath of molten zinc. Galvanizing protects in two ways:

- it forms a coating of corrosion-resistant zinc which prevents corrosive substances from reaching the more delicate part of the metal vi
- the zinc serves as a sacrificial anode so that even if the coating is scratched, the exposed steel will still be protected by the remaining zinc.

**Ignitability  
characteristic**

Ignitability characteristic identifies waste materials that can readily catch fire, combustible, flammable and sustain combustion.

**Infectious or  
Pathogenic**

A waste is also classified as hazardous if it contains infectious or pathogenic characteristics and has the ability to spread diseases or illnesses through bacteria, virus, fungus or other microorganisms.

**Organometalli  
c compounds**

Organometallic chemistry is the study of chemical compounds containing at least one bond between a carbon atom of an organic compound and a metal. Organometallic chemistry combines aspects of inorganic chemistry and organic chemistry.

**Organotin  
compounds**

Organotin compounds or stannanes are chemical compounds based on tin with hydrocarbon substituents. Organotin chemistry is part of the wider field of organometallic chemistry

**Pensky-  
Martens closed  
cup tester or a  
Seta flash  
closed cup  
tester (flash  
point test**

Determines the lowest temperature at which the fumes or vapours above a waste will ignite when exposed to flame

**Reactivity  
characteristic**

Reactivity characteristic identifies wastes that readily explode or undergo violent reactions or react to release toxic gases or fumes.

**Recovery of  
acid pickling  
liquor**

Spent pickle liquor contains a mixture of the residual unreacted free hydrofluoric and nitric acid as well as metal salts of those acids. By removing the metal fluoride and nitrate salts and replenishing the free acid concentrations with fresh acid, it is possible to extend the bath life indefinitely. This is the basis of operation of a so-called purification system.

**Smelting**

Smelting is a form of extractive metallurgy; its main use is to produce a base metal from its ore. This includes production of silver, iron, copper and other base metals from their ores.

**Soldering  
process**

Soldering is a process in which two or more metal items are joined together by melting and flowing a filler metal (solder) into the joint, the filler metal having a lower melting point than the adjoining metal.

<b>Solubility</b>	Quantity of solute dissolves into a given amount of solvent at specified temperature and pressure
<b>Toxicity</b>	Harmful effect by a poisonous substance on the human body by physical contact, inhalation or ingestion.
<b>Toxicity characteristic</b>	<p>Waste is hazardous by virtue of the toxicity characteristic if it exceeds specified concentrations of certain metals and organic compounds as listed by reference in the regulations.</p> <p>USEPA designed a laboratory procedure known as Toxicity Characteristic Leaching Procedure (TCLP) to estimate the leaching potential of waste when disposed of in a landfill. The TCLP test is to identify waste likely to leach dangerous concentrations of certain known toxic chemicals into groundwater.</p>
<b>Toxicity Characteristic Leaching Procedure (TCLP)</b>	A laboratory procedure designed by USEPA to estimate the leaching potential of waste when disposed of in a landfill.
<b>Vapour</b>	A gas phase of a component of a substance, state of matter.

## **FOREWORD**

Generation of scheduled wastes must be controlled to protect public health and the environment. Safe handling of scheduled wastes during their generation requires special knowledge of the characteristics and properties of the wastes. Hence, proper identification and classification of scheduled wastes are crucial to eliminate or minimize their potential hazards to human and pollution risks to the environment.

The current Scheduled Wastes Regulations in Malaysia have served a purpose in providing the essential regulatory framework on scheduled wastes management in Malaysia. These set of regulations encompasses the obligation and responsibility of waste generators as well as contractors in proper and safe handling of scheduled wastes. Key provision of the regulations are focused on the control of the generation of wastes by notification system, minimization of wastes generation, safe storage, licensing of scheduled wastes facilities, treatment and disposal of wastes at prescribed premises and implementation of manifest system for tracking and controlling movement of wastes.

This guidebook aims to be used as quick reference for industries in the identification and classification of scheduled wastes. It is hoped that this guidebook will further increase the level of self-compliance by the industry and thus ensure the quality of environmental sustainability and protection of public health and environment. This guide book shall be in addition to and not in derogation of any written law.

“Protecting the Environment is Our Shared Responsibility”

**(DATO' HALIMAH HASSAN)**

Director General  
Department of Environment, Malaysia  
October 2015

### IMPORTANT NOTICE

This document is intended only as a **quick reference/guide** for the identification and classification of scheduled wastes by the industries. The Department of Environment assumes no responsibility for the accuracy, adequacy, or completeness of the concepts, methodologies, or protocols described in **this quick reference/guide book**. Compliance with the regulatory requirements and standards is solely the responsibility of the industries
